TEMPO NO₂ Data
TEMPO, a collaboration between the Smithsonian and NASA, is the first space-based probe to measure air pollution hourly over North America at neighborhood scales. NO₂ (nitrogen dioxide) is one of the pollutants detected by TEMPO. It is produced by wildfires and the burning of fossil fuels. NO₂ contributes to the formation of harmful ground-level ozone and toxic particulates in the air we breathe.

What is glue?

multidimensional data exploration

It's not an acronym.

It is open-source software that
glues data,
glues graphs &
glues tools.

data

numbers (tables, arrays, spreadsheets)

images & maps (FITS, JPEG, GIS and more)

data cubes (3D, 4D, and more)

data files' common attributes are **glued**

avoiding the need to merge data files

“graphs”

common statistical graphics

(scatterplots, histograms, tables, curves, overlays)

maps & images

(greyscale, color, contours, layer control...)

3D displays

(scatter plots, volumetric rendering, sliders...)

specialized & custom charts

(dendrograms, polar plots, + domain-specific options)

selections propagate across all **graphs**

for real-time data exploration & insight

tools

plug-ins (user-defined formats, plots, layouts...)

web services (across domains)

command-line (built-in terminal, scriptable)

for easy customization

Linkable Interactive Visualization Exploration (LIVE) Environments

What is LIVE?

LIVE lets anyone build
"Linkable Interactive Visualization and Exploration" Environments.

LIVE is free, open-source, and helps with shared data and visualization challenges across astronomy (LIVE Astro), biology (LIVE Bio) and GIS (LIVE GIS).

LIVE is not just infrastructure—it is the foundation of an emerging open-source ecosystem. LIVE collaborators are building out science demonstration projects to refine and ensure the platform's utility, extensibility, and long-term sustainability.

AWS CLIMATE IMPACT COMPUTING PROPOSAL FOR “TEMPO LIVE,” 2024

PROJECT ABSTRACT / EXECUTIVE SUMMARY

Integration across the heterogeneous data sources needed to responsibly and effectively address challenges and choices posed by climate change remains remarkably difficult. In this work, we will use the opportunity presented by the stream of high temporal- and spatial- resolution satellite imaging data made possible by the new TEMPO (Tropospheric Emissions Monitoring of Pollution) satellite to create an **extensible, scalable, data integration and exploratory analysis environment (“TEMPO LIVE”) usable by researchers, public officials, and learners alike.** TEMPO leaders are collaborators and are based at the Harvard-Smithsonian Center for Astrophysics.

Thanks to our and our collaborators’ efforts in building web frameworks (e.g. Jupyter environments, Solara) and exploratory data analysis tools (glue, glupyter) and recently their union as **“LIVE environments”** and **“LIVE GIS,”** our team has abundant expertise on how to build and promote open-source online environments for data retrieval, integration, analysis, and sharing. However, even though our colleagues at NASA, the Smithsonian Institution, and NOAA are using a variety of Amazon services to provide access to TEMPO data, **current TEMPO plans do not include clear paths to real-time interactive data exploration or easy integration with *in-situ* pollution monitoring, demographic, health, or economic data sets.** In seeking direct collaboration with Amazon, HDSI and FAS RC experts, we seek to pilot the faster data access techniques, **easier integration of relevant raster, vector, and geo-referenced tabular data sources,** and **efficient hosting resource-intensive web services** needed to enable much broader use of TEMPO data, and to bring TEMPO LIVE from research-to-operations (R2O) level scale.
